

Car or Cup?

In this project you will make a Scratch project that learns to sort photos.

You will train the computer to be able to sort a set of photos into two piles:

- * one pile of photos of cars, and
- * one pile of photos of cups

1. Go to <https://machinelearningforkids.co.uk/> in a web browser
2. Click on “**Get started**”
3. Click on “**Log In**” and type in your username and password
If you don't have a username, ask your teacher or group leader to create one for you.
If you can't remember your username or password, ask your teacher or group leader to reset it for you.
4. Click on “**Projects**” on the top menu bar
5. Click the “**+ Add a new project**” button.
6. Name your project “**car or cup**” and set it to learn how to recognise “**images**”.
Click the “**Create**” button

Start a new machine learning project

Project Name *
car or cup

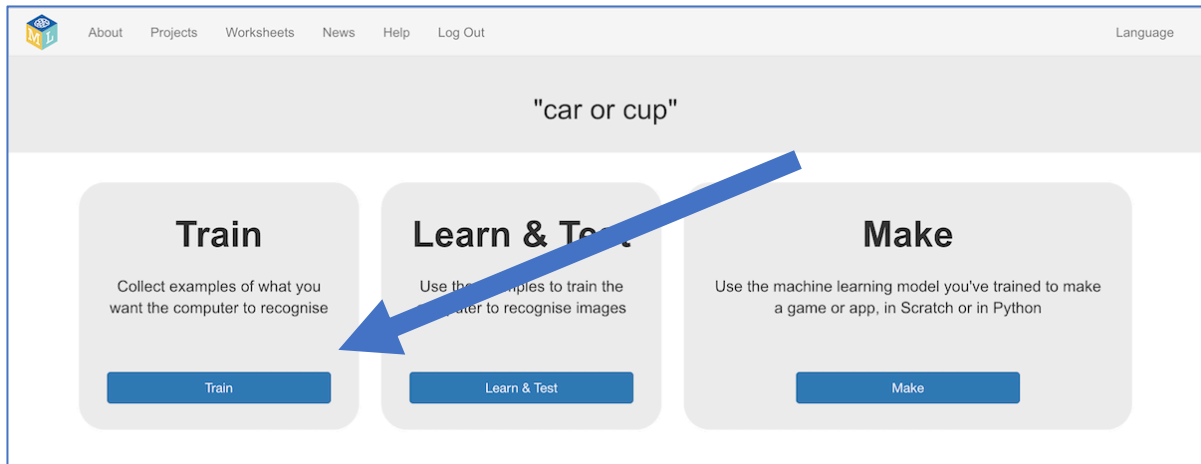

Recognising *
images

What type of thing do you want to teach the computer to recognise?
For words, sentences or paragraphs, choose "text"
For photos, diagrams and pictures, choose "images"
For sets of numbers or multiple choices, choose "numbers"
For voices and sounds, choose "sounds"

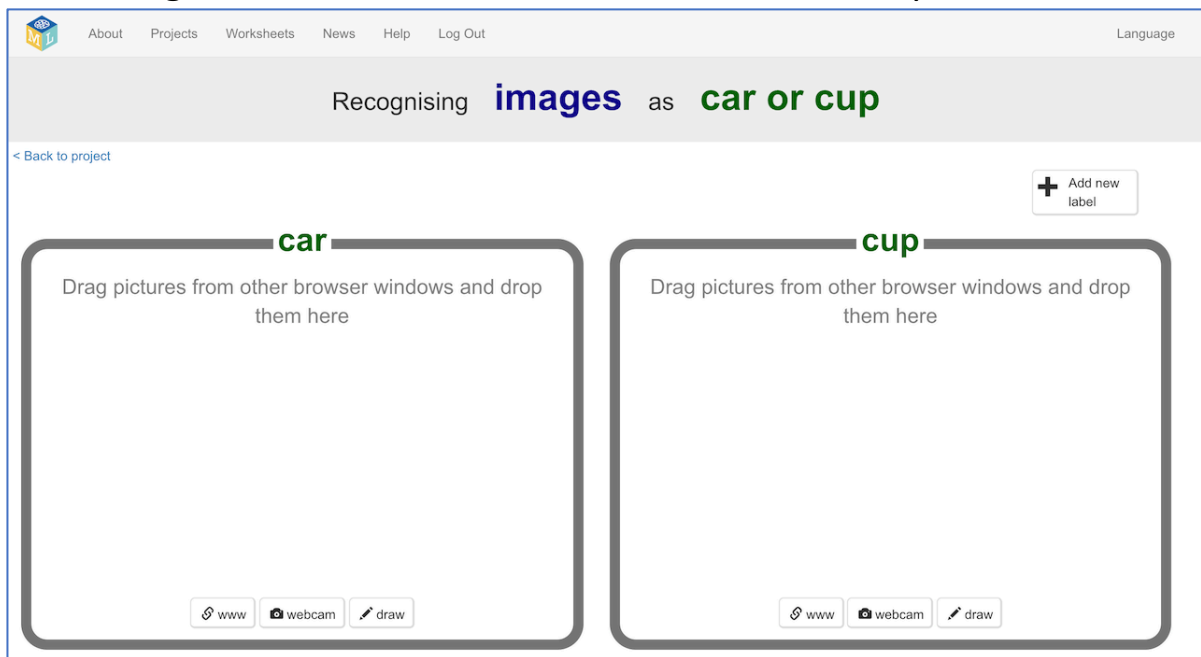

CREATE CANCEL

7. You should now see “**car or cup**” in the list of your projects.
Click on it.

8. Click the **“Train”** button to start collecting examples.

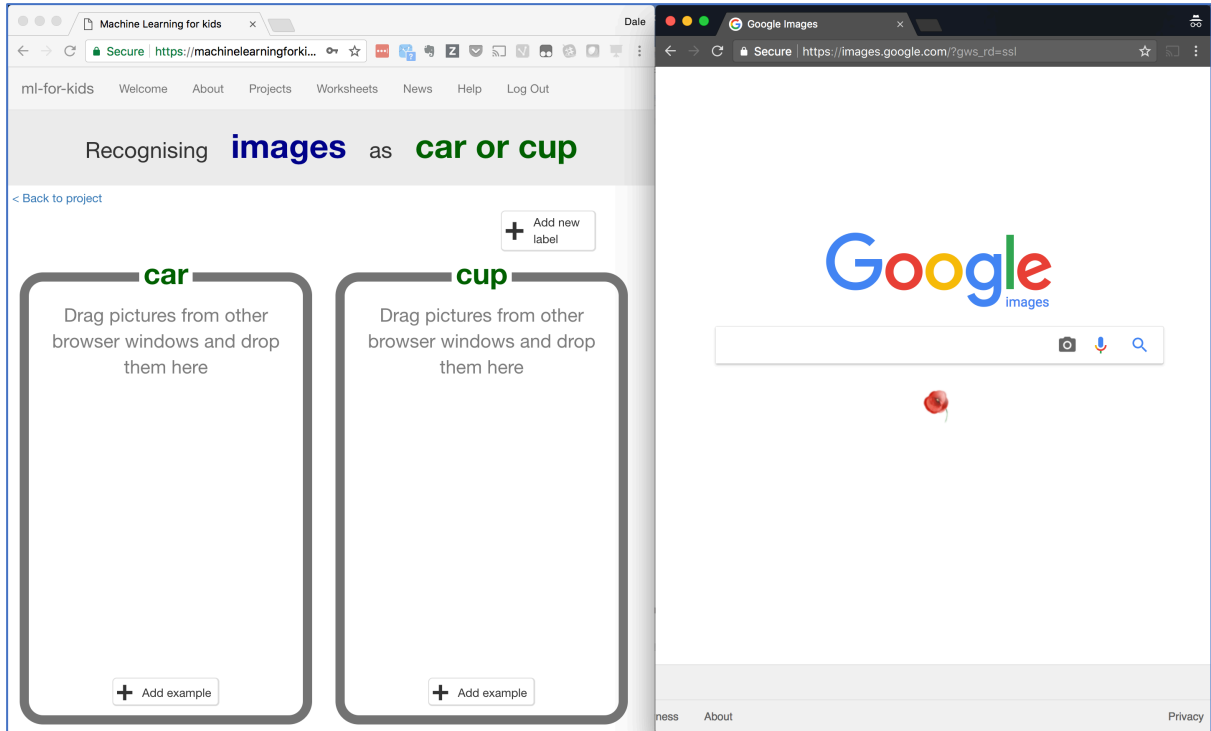

9. Click on **“+ Add new label”** and call it **“car”**.
Do that again, and create a second bucket called **“cup”**.

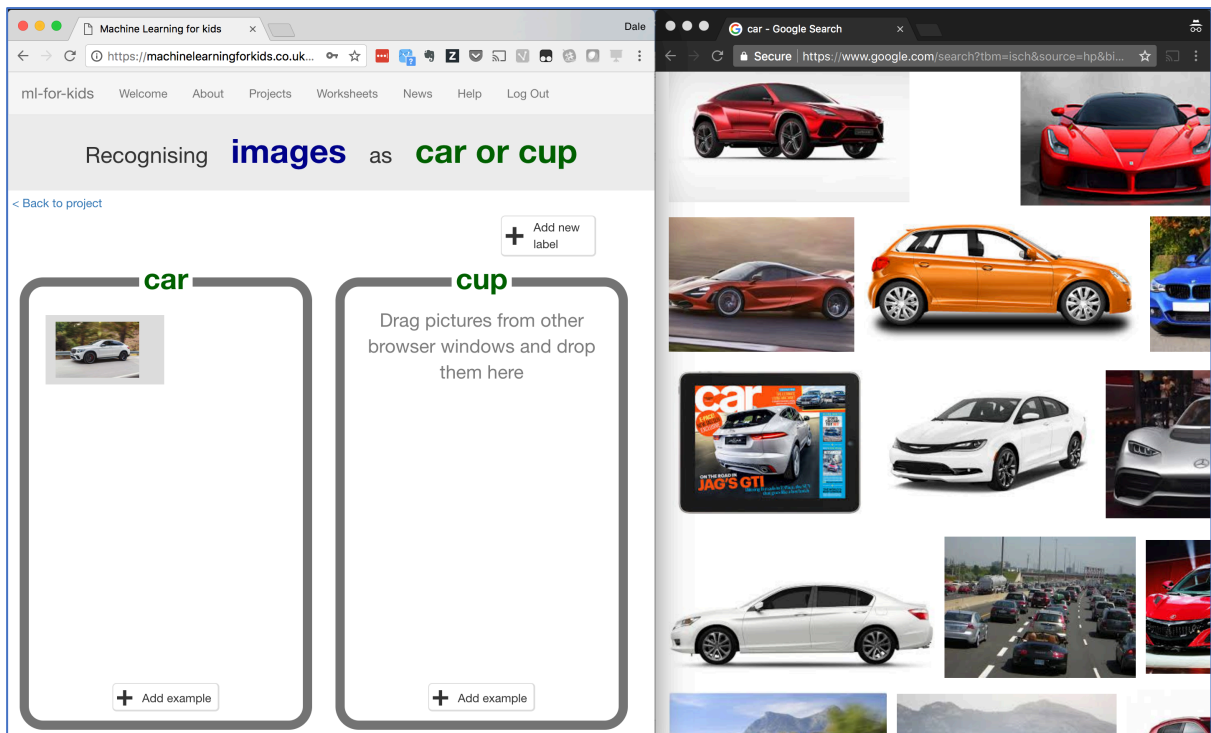

10. Open another web browser window.

11. Arrange the web browser windows so that they are side by side.

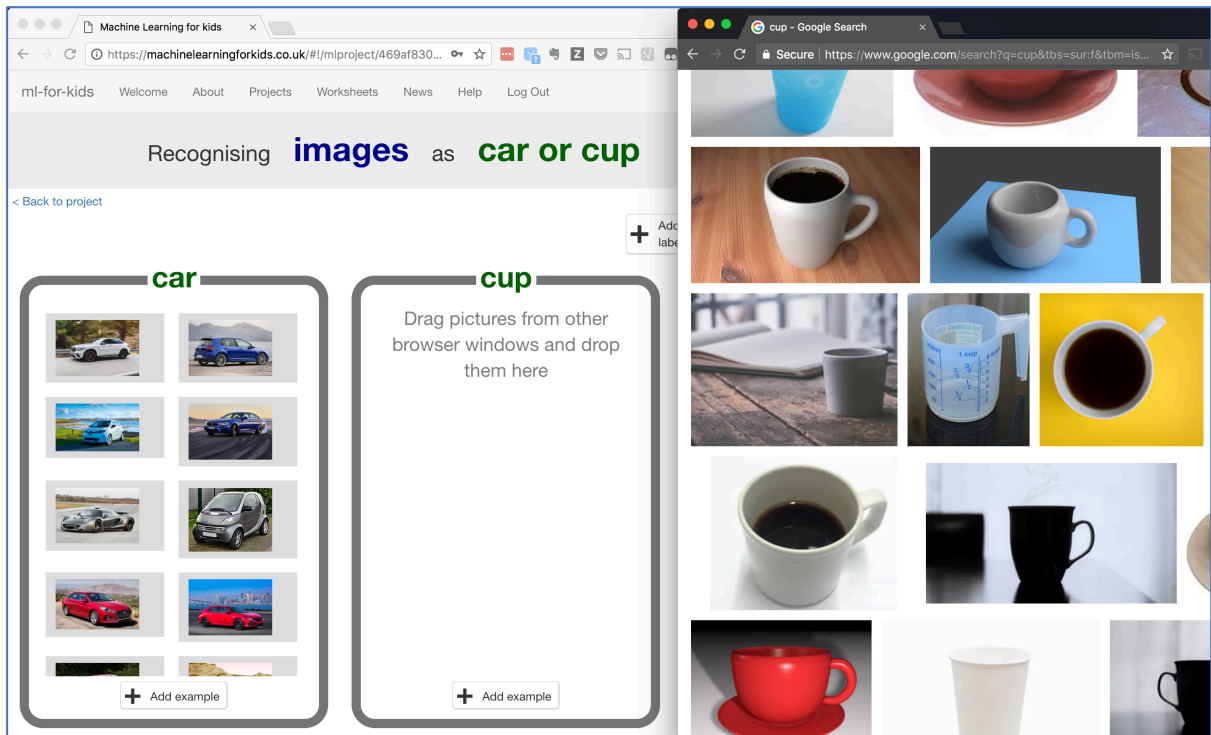

12. In the new browser window, search for pictures of cars. Drag pictures that are good examples of a car into the left bucket.

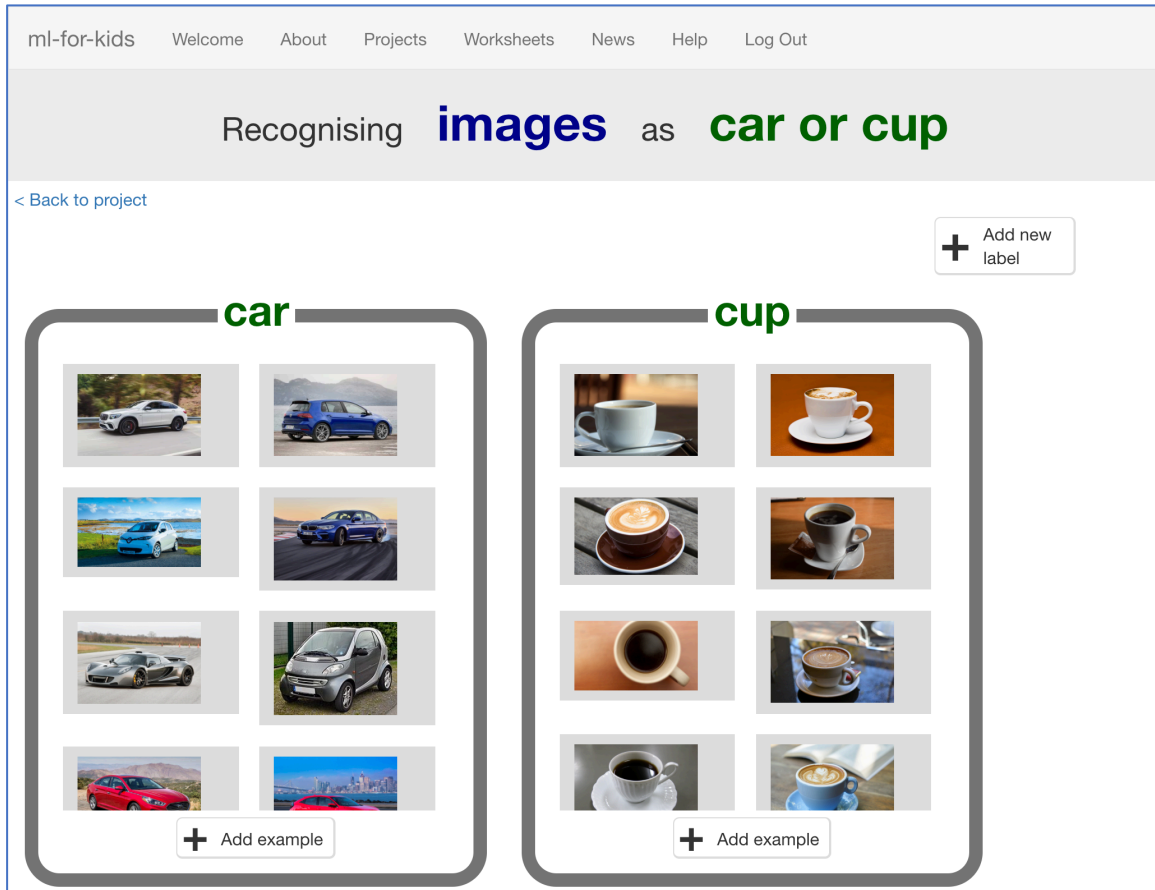

13. Repeat until you've got 10 examples of car photos.

- 14.** Search for pictures of cups.
Drag pictures that are good examples of a cup into the right bucket.

- 15.** Repeat until you have 10 examples of cup photos.

16. Click the “< Back to project” link.

17. Click the “Learn & Test” button

18. Click the “Train new machine learning model” button

The screenshot shows the 'Machine learning models' page. At the top, there is a navigation bar with links for 'About', 'Projects', 'Worksheets', 'News', 'Help', and 'Log Out', along with a 'Language' dropdown. Below the navigation bar, the page title 'Machine learning models' is centered. A link '< Back to project' is visible on the left. The main content area is divided into two columns: 'What have you done?' and 'What's next?'. The 'What have you done?' section states that the user has collected examples of images for a computer to use to recognise when images are car or cup, and lists '10 examples of car' and '10 examples of cup'. The 'What's next?' section asks if the user is ready to start the computer's training and provides instructions on how to start training a machine learning model using the collected examples. Below these sections, there is a box titled 'Info from training computer:' containing a blue button labeled 'Train new machine learning model'. A large blue arrow points from the 'What's next?' section towards this button.

19. Wait for the training to complete. This might take a few minutes.

The screenshot shows the 'Machine learning models' page after training has started. The navigation bar and page title are the same as in the previous screenshot. The 'What have you done?' section now states that the user has started training a machine learning model using the collected examples and provides the start time: 'Monday, April 15, 2019 9:28 PM'. It also notes that training normally takes a few minutes but can take longer if the computer is busy. The 'What's next?' section suggests waiting for the model to finish training or trying a quiz. The 'Info from training computer:' box now displays the following information: 'Model started training at: Monday, April 15, 2019 9:28 PM', 'Current model status: Training', and 'Model last checked: a few seconds ago'. A red button labeled 'Cancel training' is visible at the bottom of this box.

What have you done so far?

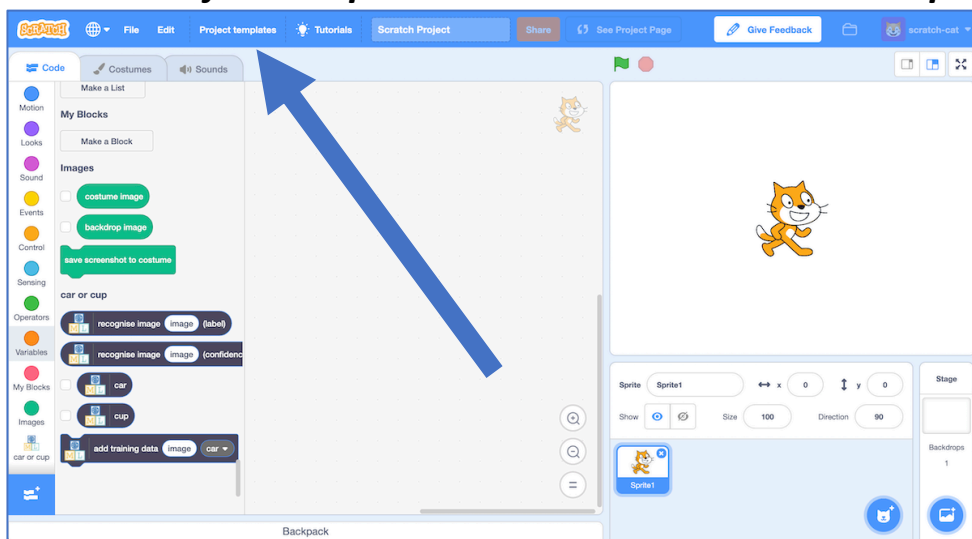

You've started to train a computer to recognise pictures of cups and cars. Instead of trying to write rules to be able to do this, you are doing it by collecting examples. These examples are being used to train a machine learning “model”.

This is called “supervised learning” because of the way you are supervising the computer’s training.

The computer will learn from patterns in the example photos you’ve chosen, such as the shapes and the use of colour. These will be used to be able to recognise new images.

20. Click the “< Back to project” link
21. Click the “Make” button, and then the “Scratch 3” button.
22. Click the “Open in Scratch 3” button
23. Load the **Car or cup** template

Click on **Project templates** and then click on **Car or Cup**

Tips

More examples!

The more examples you give it, the better the computer should get at recognising whether a photo is a cup or car.

Try and be even

Try and come up with roughly the same number of examples for cups and cars.

If you have a lot of examples for one type, and not the other, the computer might learn that type is more likely, so you'll affect the way that it learns to recognise photos.

Mix things up with your examples

Try to come up with lots of different types of examples.

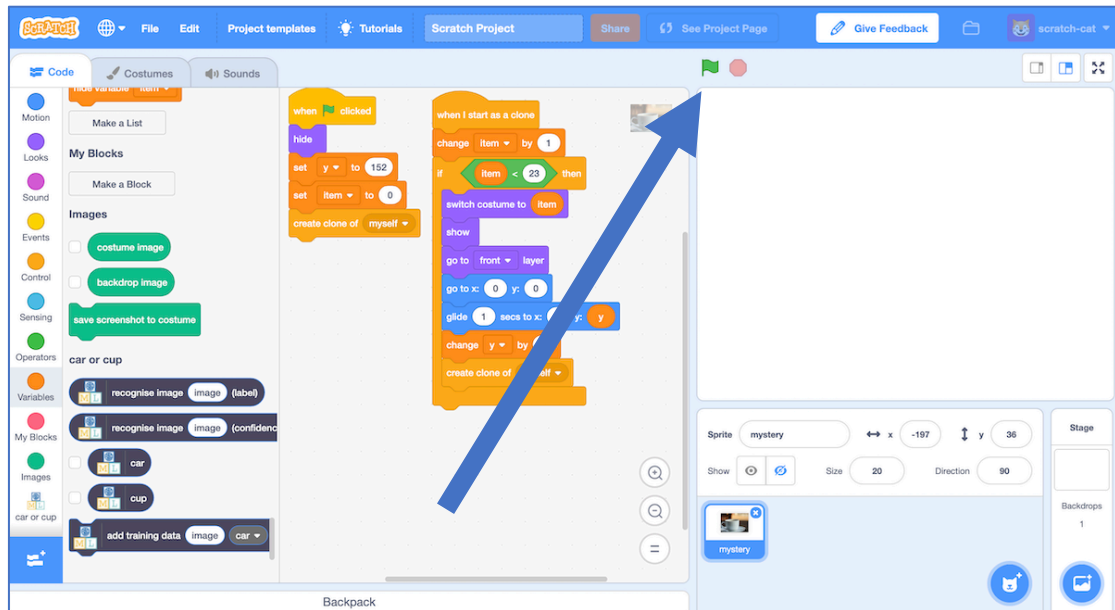

For example, make sure that you include some examples with different backgrounds.

If every photo of a car you use for training has grass in the background, and every photo of a cup you use for training is on a wooden table, you might end up training the computer to recognise grass or wood instead.

24. Click the **green flag** to give it a try.

The project has several random photos or cars or cups.

Next you will modify the project to use the training you've given the computer, so that it can sort these photos into two piles.

25. Click on the “mystery” sprite, then the “Code” tab, and **change the script** to use your machine learning model.

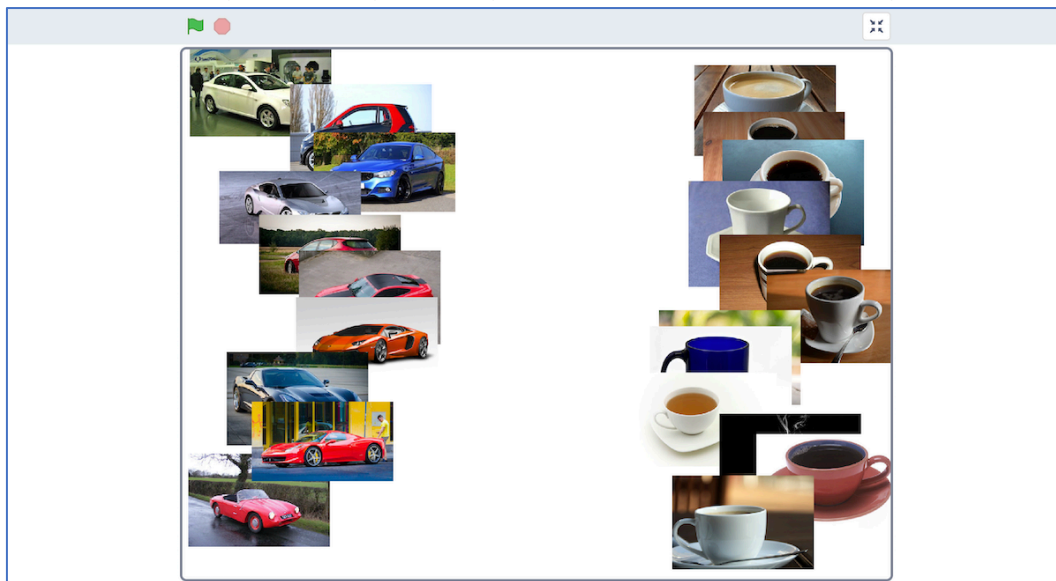

Start from the script that is already there and change it to look like this.

26. Click the **full screen** icon, and then click the **green flag**

27. Watch your script use your model to sort the photos into two piles.

28. If your trained system makes mistakes, you'll need to go back to step 14, and collect more examples.
Make sure you repeat step 18 to train a new model.

What have you done?

You've used machine learning to build an automatic photo sorter.

Training the computer to be able to recognise photos for itself is much much quicker than trying to sort thousands of photos manually.

The more examples you give it, the better it should get at recognising photos correctly.

Ideas and Extensions

Now that you've finished, why not give one of these ideas a try?

Or come up with one of your own?

Add a third type of photo

Instead of just recognising cups and cars, can you add a third type as well?

Try confusing the computer

Train the computer to recognise cars with ten photos of a car on a grass background.

Train the computer to recognise cups with ten photos of a cup on a plain white background.

Now see if the computer recognises a car on a plain white background.

Or if it can recognise a cup on a grass background.

Does the computer get confused? Did it learn to recognise the cup and car? Or was it more influenced by the background?

Experiment to find out how the computer learns, and how it behaves.
